# AI/ML-Driven Automated Feature Detection and Change Analysis

## From Multi-Source Satellite Imagery

This presentation outlines a novel approach to automatically detect and analyze changes in critical geographical features using advanced Artificial Intelligence and Machine Learning techniques applied to multi-source satellite imagery.

The focus areas include glacial lakes, road networks, and urban drainage systems, providing timely and accurate insights for environmental monitoring, infrastructure management, and urban planning.

# Opportunity: Why Our Solution Stands Out

## How different?

Leverages multi-source satellite imagery (SAR, Optical) and advanced AI/ML models (U-Net, DeepLabV3+, SAM, Random Forest) for comprehensive feature detection and change analysis. Enhanced accuracy and robustness across challenging conditions (cloud, shadow, snow) compared to single-source methods.

## USP:

Multi-temporal change analysis with high accuracy and scalability across diverse terrains and timeframes. Integration of various satellite data and state-of-the-art AI/ML models ensures reliable detection in complex environments, offering a robust and comprehensive monitoring solution.

## Solves the problem by:

Automating labor-intensive manual tracking of glacial lakes, road networks, and urban drainage systems. Provides timely, accurate geospatial vector data (shapefiles/GeoJSON) and interactive dashboards for proactive decision-making in environmental monitoring, disaster management, and infrastructure planning.

## Features:

Automated detection & delineation (glacial lakes, roads, urban drainage).

Multi-temporal change analysis.

Multi-source satellite imagery (SAR & Optical).

High accuracy & robustness in challenging conditions. Geospatial vector data output (shapefiles, GeoJSON).

Interactive dashboard visualization (e.g., Google Earth Engine).

User-driven querying & downloadable outputs.

Scalability to pan-Himalayan/global regions.

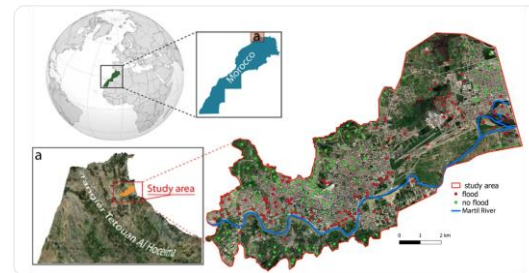

# Visual Representations

Glacial Lake Detection

Road Network Extraction

Urban Drainage Mapping

AI/ML in Satellite Imagery

ML Algorithms Application

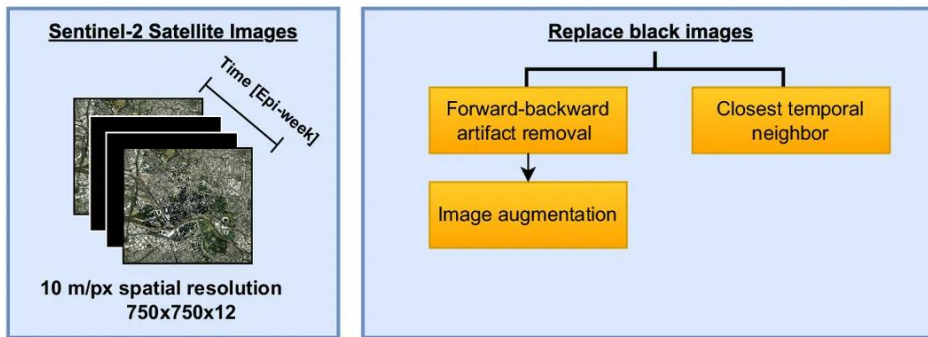

Geospatial AI Potential

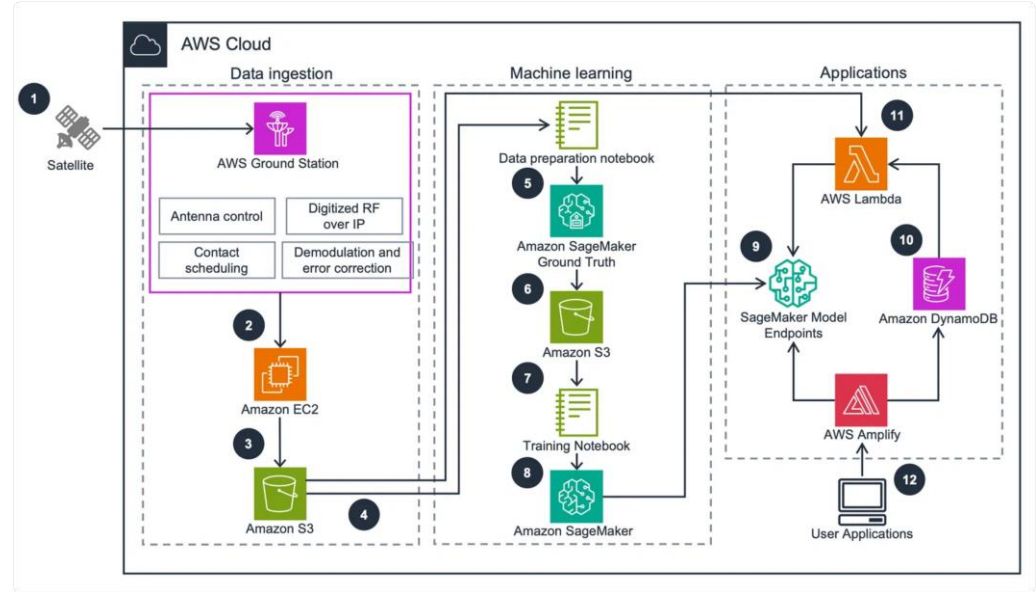

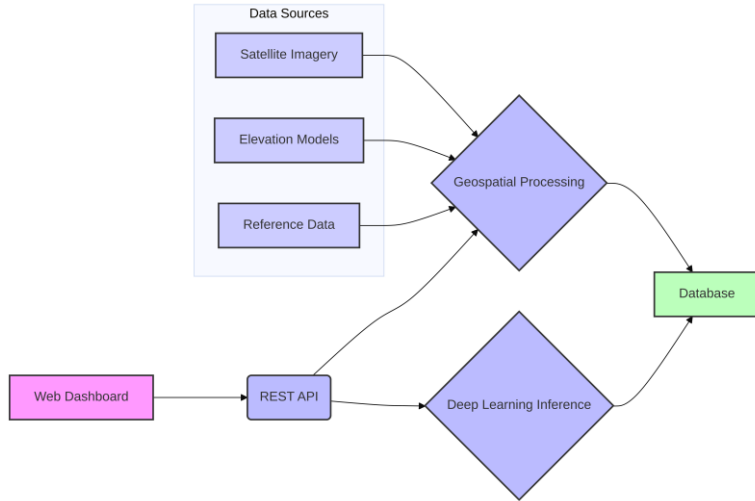

Stage 1: Parameter initialization

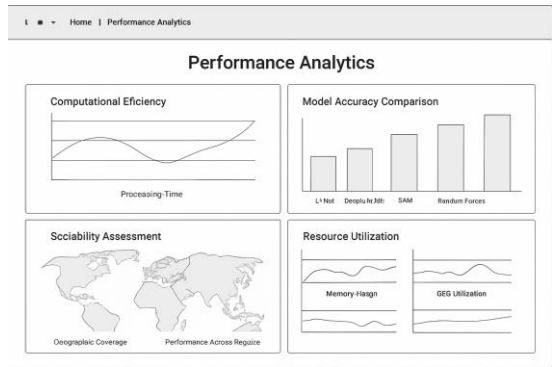

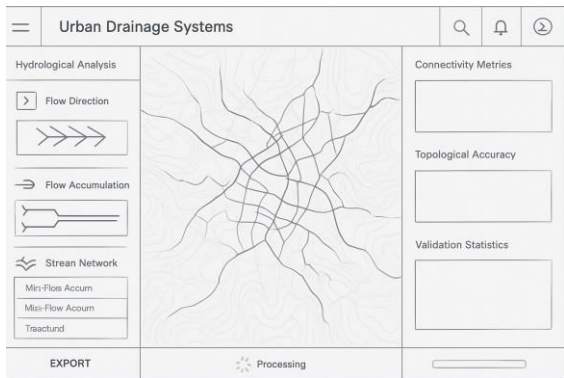

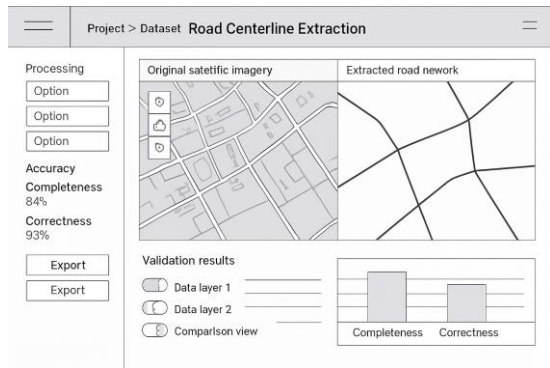

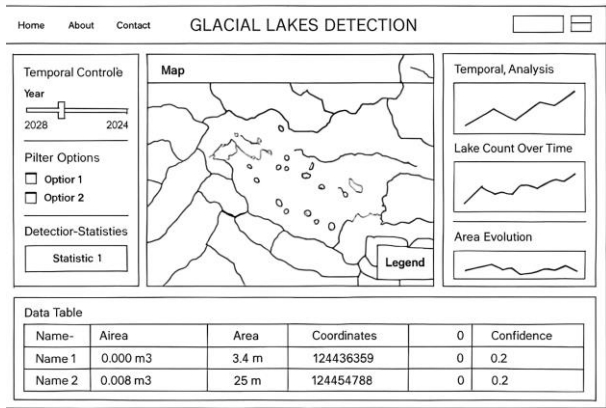

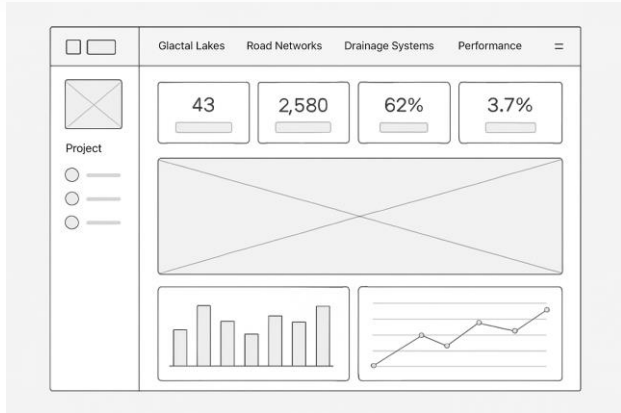

Stage 2: Recursive artifact removal

Stage 3: Hash encryption

# Technologies to be Used in the Solution

## Programming & ML Frameworks

Python as the primary programming language  
TensorFlow / PyTorch for deep learning models  
scikit-learn for traditional ML algorithms  
GDAL, Rasterio, GeoPandas for geospatial data processing

## Data Sources & Processing

Sentinel-1A/1B (SAR) imagery  
Sentinel-2A/2B (optical) imagery  
Landsat 5/7/8/9 via Google Earth Engine  
NRSC-GL Inventory, GLIMS, Hi-MAG, ICIMOD datasets

## AI/ML Models

U-Net for semantic segmentation  
DeepLabV3+ for feature extraction  
Segment Anything Model (SAM) for object detection  
Random Forest for classification tasks

## Visualization & Deployment

Google Earth Engine for interactive visualization  
Web-based dashboard using Flask/Django  
Cloud infrastructure (AWS/GCP) for scalability  
Docker containers for deployment consistency

## Development Resources (Hackathon)

Cloud Computing Credits (AWS/GCP)	\$500
API Access for Satellite Data	\$0
Development Tools & Libraries	\$0

## Hardware Requirements

GPU Access for Model Training	\$200
Storage for Satellite Imagery	\$100

## Team Resources

Collaboration Tools	\$0
Prototype Deployment	\$100

**Total Hackathon Implementation     \$900**

Hackathon Cost Breakdown
